

Soundtube WLL-TX1 Uncompressed 2-Channel Audio Wireless Transmitter

The WLL-TX1 wireless transmitter unit transmits uncompressed stereo audio wirelessly for maximum fidelity. An additional 9 receivers (for a total of 10) may be ordered to accompany the included single transmitter. Two additional transmitters can be used with separate frequencies with a total of up to 30 receiver units. Each transmitter/receiver contains 3 RF channels to minimize interference from other devices. Each channel contains 3 bands, alternating between them to preemptively counteract interference, keeping the signal clear and latency less than 20ms. Audio input options for the transmitter unit include USB, stereo mini or 1/4" balanced input connections at the transmitter. Each channel contains 3 bands, alternating between them to preemptively counteract interference, keeping the signal clear and latency less than 20ms. A High/Low power selector switch on transmitter limits RF range where needed.
